The Banook Woods condominium buildings are located on the beautiful Lake Banook in Dartmouth, Nova Scotia. These buildings are in an ideal location close to the busy Burnside Industrial Park, Dartmouth Crossing, Mic Mac Mall and downtown Dartmouth, while at the same time nestled in a quiet residential community.

Built in 1989, the architects decided to use architectural precast panels as their exterior cladding which was not a conventional choice of material at the time. This decision was made for a number of reasons including the speed of erection. By using precast the General Contractor was able to reduce the overall construction schedule, allowing tenants to move in sooner. Another advantage was design flexibility. The architect was able to chose a white cement and sand with an imported white marble aggregate for the main body of the panel along with a darker colour aggregate used between the windows, showing a contrast between the two colours. Strescon Limited produced 43,189 sq.ft. (534 pieces) of architectural precast panels for this project.
